APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): August 20, 2007

B. ST PAUL, MN DISTRICT OFFICE, FILE NAME, AND NUMBER: 2007-2003-DJP, Fed Ex New Berlin, Proposal Access Road and Pedestrian Crossing

State: Wisconsin County/parish/borough: Waukesha City: New Berlin Center coordinates of site (lat/long in degree decimal format): Lat. 43.00699° N. Long. 88.12054° W. Universal Transverse Mercator: Zone 16, 408674E, 4761985N Name of nearest waterbody: Deer Creek Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Fox River Name of watershed or Hydrologic Unit Code (HUC): Upper Fox, Illinois, Wisconsin Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request. Check if other sites (e.g., offsite mitigation sites, disposal sites, etc) are associated with this action and are recorded on a different JD form. D. REVIEW PERFORNED FOR SITE EVALUATION (CHECK ALL THAT APPLY): Office (Desk) Determination. Date: July 25, 2007 Field Determination. Date(s): April 23, 2007 SECTION II: SUMMARY OF FINDINGS A. RHA SECTION 10 DETERMINATION OF JURISDICTION. There Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required] Waters subject to the ebb and flow of the tide. Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce Explain: B. CWA SECTION 404 DETERMINATION OF JURISDICTION. There Are "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required] 1. Waters of the U.S. a. Indicate presence of waters of U.S. in review area (check all that apply): 1 TNWs, including territorial seas Wetlands adjacent to TNWs Relatively permanent waters? (RPWs) that flow directly or indirectly into TNWs Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Impoundments of jurisdictional waters Isolated (interstate or intrastate) waters, includin	C. 		Non-wetland waters: 1575 linear feet: 6 width (ft) and/or acres.
c. Limits (boundaries) of jurisdiction based on: 1987 Delineation Manual		Wetlands: 5.63 acres.
Flavation of actablished OHWM (if known):		

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.
² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

2.	Nor	n-regulated Potentially Explain:	waters/wetlar jurisdictional	nds (check if appl waters and/or wet	licable): ³ lands were assess	sed within the rev	iew area and dete	rmined to be not	jurisdictional.

 $^{^{\}rm 3}$ Supporting documentation is presented in Section III.F.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1.	TNW Identify TNW:
	Summarize rationale supporting determination: .
2.	Wetland adjacent to TNW Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i)	General Area Conditions:
	Watershed size: 24.3 square miles
	Drainage area: 1 square miles
	Average annual rainfall: 34-35 inches
	Average annual snowfall: 40-50 inches
(ii)	Physical Characteristics:
	(a) Relationship with TNW:
	☐ Tributary flows directly into TNW.
	☐ Tributary flows through 2 tributaries before entering TNW.
	Desired and the Fig. 5 10 since will a few TNW
	Project waters are 5-10 river miles from TNW.
	Project waters are 1 (or less) river miles from RPW.
	Project waters are 5-10 aerial (straight) miles from TNW.
	Project waters are 1 (or less) aerial (straight) miles from RPW.
	Project waters cross or serve as state boundaries. Explain:

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):	

Identify flow route to TNW5: The unnamed channelized stream flows to Deer Creek, which flows

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW. ⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break. ⁷Ibid.

(iii) Chemical Characteristics:

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain: Water was not present in the channel during the April 2007 site visit. Since the ditch serves an industrial park and gathers runoff from parking lots and roof tops, it is presumed that the water would contain suspended solids and an oily film.

Identify specific pollutants, if known: Since the ditch serves an industrial park and gathers runoff from parking lots and manicured lawn areas, it is presumed that the water would contain automotive fluids such as oil, grease, anti freeze, and other automotive fluids as well as lawn maintenance chemicals. In winter months the runoff from the parking lots would also contain road salt and sand.

	gical Characteristics. Channel supports (check all that apply):
	Riparian corridor. Characteristics (type, average width): The riparian corridor varies in width from as
	eet to as much as 300 feet. It is estimated that the average riparian corridor with would be
	rely 75 feet
	Wetland fringe. Characteristics: The wetland fringe is comprised of fresh wet meadow with
	arrow leafed vegetation and a shrub carr with broad-leafed decidious shrubs, shallow
	narrow leafed persistent vegetation, and hardwood swamp with broad leafed deciduous
	wetland delineation completed at the site indicate that the dominant vegetation consists of
	l canary grass, stinging nettle, pussy willow, sand bar bar willow, elderberry shrubs, and
	conwood trees
Ш	Habitat for: ☐ Federally Listed species. Explain findings: .
	Fish/spawn areas. Explain findings:
	Other environmentally-sensitive species. Explain findings:
	Aquatic/wildlife diversity. Explain findings: .
2. Characte	ristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
	ical Characteristics:
	General Wetland Characteristics: Properties:
	Wetland size: 12.8 acres
	Wetland type. Explain: The wetland delineation provided by the applicant describes the
wetland co	mplex as a combination of shallow marsh, shrub carr, fresh wet meadow, and hardwood
swamp	
1	Wetland quality. Explain: A MnRAM assessment completed for the wetland complex was of
low to med	ium quality
	Project wetlands cross or serve as state boundaries. Explain:
	General Flow Relationship with Non-TNW: Flow is: Intermittent flow. Explain:
	riow is: intermittent now. Explain:

	Characteristics: .
	Subsurface flow: Unknown. Explain findings: .
	Dye (or other) test performed:
(c)	Wetland Adjacency Determination with Non-TNW:
	 ☑ Directly abutting ☑ Not directly abutting
	☐ Discrete wetland hydrologic connection. Explain: T.
	Ecological connection. Explain: 1.
	Separated by berm/barrier. Explain:
(d)	Proximity (Relationship) to TNW
	Project wetlands are 5-10 river miles from TNW.
	Project waters are 5-10 aerial (straight) miles from TNW. Flow is from: Wetland to navigable waters.
	Estimate approximate location of wetland as within the 100 - 500-year floodplain.
` /	nical Characteristics: acterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed
	characteristics; etc.). Explain: Standing water was not present in the wetland during the April,
	2007 site visit
Ident	ify specific pollutants, if known: Unknown.

 ${\bf (iii) \ Biological \ Characteristics. \ Wetland \ supports \ (check \ all \ that \ apply):}$

⊠ F	tiparian buffer. Characteristics (type, average width):Fresh wet meadow and shrub carr varying in with
from 20 feet	to 300 feet
	Vegetation type/percent cover. Explain: Fresh wet meadow, 60% and shrub carr 40% Habitat for:
	Federally Listed species. Explain findings: Fish/spawn areas. Explain findings: Other environmentally-sensitive species. Explain findings:
	Aquatic/wildlife diversity. Explain findings: The 12.8 acre wetland complex is expected to provide birds, small mammals, amphibians, and insects
All we	istics of all wetlands adjacent to the tributary (if any) etland(s) being considered in the cumulative analysis: I eximately (12.8) acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

Directly abuts? (Y/N) Size (in acres) Directly abuts? (Y/N) Size (in acres)
Y 12.8

Summarize overall biological, chemical and physical functions being performed: The 12.8 acre wetland complex is a remnant of a larger wetland that was filled in the past for the development of an industrial park. Since the wetland is surrounded by development that includes large parking lots, large roof tops, streets, and landscaped manicured lawns it would provide a collection point for local storm water runoff during and after precipitation events. The storm water would flow through the wetland, in to the channelized steam which discharges into Deer Creek, which is tributary to the Fox River, via Poplar Creek. The velocity of the runoff flowing through the wetland would allow for the filtration of sediments and suspended solids from the water before it reaches the Fox River. In addition, during low precipitation periods, surface water would pond within the 12.8 acre wetland allowing for further settling of sediments and providing time for nutrients to be absorbed and stored by the persistent vegetation. In addition to the sediment filtering and nutrient removal, the wetland would also serve to temporarily store flood waters.

The wetland would also provide habitat for local wildlife. The wetland is expected to provide habitat for song birds, small mammals, amphibians, and insects.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: The intermittent channelized stream flows directly into Deer Creek via a culvert and ditch that allows flow to pass under the railroad spur and historic dredged material bank. Deer Creek flows directly to Poplar Creek which flows directly to the Fox River, an interstate navigable water of the United States. The wetland delineation provided by the

applicant and the available aerial photography clearly show that the review area and relevant reach wetlands abut the intermittent channelized stream. The wetlands are located amid an industrial park development and receive local runoff from rooftops, parking lots, street, and landscaped upland areas. The surface runoff directed to the wetland contains pollutants such as automotive fluids, lawn maintenance chemicals, road salt, and sediment. The 12.8 acre wetland complex also provides an area that holds a small volume of water that otherwise would contribute to downstream flooding. The 12.8 acre wetland complex provides significant water quality benefits to the overall Fox River watershed by providing the filtration of surface water runoff from the adjacent industrial park. In addition to water quality benefits, the wetland complex also provides an island of wildlife habitat within an urbanized area. Since the wetland provides significant water quality functions as wee as flood water storage, it has a significant nexus with the downstream traditional navigable water.

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

ТН	AT APPLY):
1.	TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area: ☐ TNWs: linear feet width (ft), Or, acres. ☐ Wetlands adjacent to TNWs: acres.
2.	RPWs that flow directly or indirectly into TNWs. ☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: ☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
	Provide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: .
3.	Non-RPWs ⁸ that flow directly or indirectly into TNWs. Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional waters within the review area (check all that apply): Tributary waters: 1575 linear feet6width (ft). Other non-wetland waters: acres. Identify type(s) of waters: .
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Provide acreage estimates for jurisdictional wetlands in the review area: acres.

8See Footnote # 3.

9

	5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.
		Provide acreage estimates for jurisdictional wetlands in the review area: 5.6 acres.
	6.	Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
		Provide estimates for jurisdictional wetlands in the review area: 5.63 acres.
	7.	As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional. Demonstrate that impoundment was created from "waters of the U.S.," or Demonstrate that water meets the criteria for one of the categories presented above (1-6), or Demonstrate that water is isolated with a nexus to commerce (see E below).
E.	DEC SUC 	LATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, GRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY CH WATERS (CHECK ALL THAT APPLY): 10 which are or could be used by interstate or foreign travelers for recreational or other purposes. from which fish or shellfish are or could be taken and sold in interstate or foreign commerce. which are or could be used for industrial purposes by industries in interstate commerce. Interstate isolated waters. Explain: Other factors. Explain: other factors. Explain:
	Prov	ride estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: Wetlands: acres.
F.	NOI	N-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY): If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements. Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce. Prior to the Jan 2001 Supreme Court decision in "SWANCC," the review area would have been regulated based solely on the "Migratory Bird Rule" (MBR). Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain: Other: (explain, if not covered above):
	facto	vide acreage estimates for non-jurisdictional waters in the review area, where the <u>sole</u> potential basis of jurisdiction is the MBR ors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional ment (check all that apply): Non-wetland waters (i.e., rivers, streams): linear feet width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: Wetlands: acres.

⁹ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.

¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.

a find	de acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such ling is required for jurisdiction (check all that apply): Non-wetland waters (i.e., rivers, streams): linear feet, width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: Wetlands: acres.

B. ADDITIONAL COMMENTS TO SUPPORT JD: The intermittent channelized stream flows directly into Deer Creek via a culvert and ditch that allows flow to pass under the railroad spur and historic dredged material bank. Deer Creek flows directly to Poplar Creek which flows directly to the Fox River, an interstate navigable water of the United States. The wetland delineation provided by the applicant and the available aerial photography clearly show that the review area and relevant reach wetlands abut the intermittent channelized stream. The wetlands are located amid an industrial park development and receive local runoff from rooftops, parking lots, street, and landscaped upland areas. The surface runoff directed to the wetland contains pollutants such as automotive fluids, lawn maintenance chemicals, road salt, and sediment. The 12.8 acre wetland complex also provides an area that holds a small volume of water that otherwise would contribute to downstream flooding. The 12.8 acre wetland complex provides significant water quality benefits to the overall Fox River watershed by providing the filtration of surface water runoff from the adjacent industrial park. In addition to water quality benefits, the wetland complex also provides an island of wildlife habitat within an urbanized area. Since the wetland provides significant water quality functions as wee as flood water storage, it has a significant nexus with the downstream traditional navigable water.

Boundary for Relevant Reach (Exhibit 5), Development Plan (Exhibit 6), MnRAM Evaluation

(Admin. Record).
